

VoiceOps Sentinel

Voice-driven nginx incident investigation
with verifiable evidence

AssemblyAI Voice Agent Hackathon

READ-ONLY

Public demo: voiceops-sentinel.onrender.com

PROBLEM

The first five minutes of a 502 incident

An on-call engineer needs a defensible first answer before touching production.

VoiceOps listens to the question, runs a bounded read-only investigation, and shows the evidence behind the result.

**“Why is nginx
returning 502?”**

Spoken question
Canonical report
Read-only follow-up

One voice request, one controlled path

The browser never submits raw LogQL or trusted evidence. The server chooses the fixture and builds the report.

Grounded by evidence

The displayed report remains canonical when a spoken paraphrase varies.

EXACT EVIDENCE

The report cites the server-owned log record.

INDEPENDENT CHECKS

Schema, provenance, and diagnostic policy validate separately.

CAPABILITY LIMIT

No shell, restart, or infrastructure write tool exists.

Synthetic fixture data · Business impact not measured

Five scenarios test the safety boundary

01	Connection refused	error 111
02	Upstream timeout	error 110
03	Checked window	200 OK only
04	No records	unknown cause
05	Injected log line	treated as data

Every scenario requires the expected status and cause, successful tool execution, three report validations, and a clean end.

Hosted technical matrix: 15 of 15

15/15

selected hosted voice runs passed

85.79 ms

average tool request

93.7 ms

sample p95

Hosted controls checked

Two concurrent voice reservations allowed; third rejected. Voice and investigation rate limits triggered as configured.

Latency covers the tool request, not the full conversation. Daily quota state resets on restart.
